ABSTRACT OF THE DISCLOSURE

A defect correcting method for a liquid crystal panel is disclosed, comprising the step of, when plurality of pixels are connected, cutting off pixel electrodes of other pixels from a signal supply line in such a way as to drive the other pixels by a TFT of a filter of a highest light pixel having а color transmittance among the plurality of pixels. Another defect correcting method for a liquid crystal panel is the liquid crystal panel including disclosed, correcting wiring formed beforehand to connect pixels adjacent to each other, comprising the step of: when a defective pixel occurs, electrically connecting a pixel electrode of the defective pixel to that of a pixel adjacent to the defective pixel.
